

How EHE Health Puts Your Safety First

EHE Health upholds the highest standards for safety in our clinics and clinic partners. We have instituted safety protocols in all locations. We continue to evaluate these protocols regularly, making appropriate adjustments as we obtain more data on optimal infection control, best practices and safety protocols from the CDC and other clinical authorities.

Here are some of the steps we take:

For EHE Clinical staff, support and HQ employees

EHE Health employees complete daily a COVID-19 screening Survey Questionnaire and temperature check daily to assess for the presence of any signs and symptoms consistent with COVID-19. Additionally, employees working in our clinical environments are tested on a weekly basis with an COVID-19 Screening test. (Currently, the COVID-19 Antibody test.)

In addition, all EHE Health clinics and network providers will continue with their operational safety protocols that include maintaining physical distance, wearing a facemask, performing hand hygiene, and reinforcing enhanced disinfection protocols.

For patients

Patients requesting COVID-19 testing, they will be referred out to the Safe at Work™ team for fulfillment and management. All EHE owned clinic employees will adhere to weekly COVID-19 screening. Employees who screen positive will be referred out for confirmatory testing.

Within our Clinical environment

Our clinics utilize hospital-grade disinfectants and have implemented enhanced, more frequent cleaning. We've also reconfigured our seating in shared spaces to allow for social distancing.

NOTE

EHE Health has updated its COVID-19 testing policy for patients.

EHE Health uses clinical evidence to determine best practices in every service we provide. Since we resumed our preventive care exams, EHE Health has been screening patients for COVID-19 symptoms and/or exposure with the following five (5) touchpoints in our owned clinics and majority of network partners:

- 1.** An email-based COVID-19 Screening Questionnaire sent 72 hours prior to the scheduled appointment.
- 2.** Follow up pre-screening confirmation calls 24-48 hours prior to the scheduled appointment.
- 3.** A third completion of the COVID-19 Screening Survey Questionnaire upon arrival to the scheduled appointment.
- 4.** A temperature check.
- 5.** A point-of-care IgM/IgG antibody screening test to exclude asymptomatic infections.

The Data and Background

Out of over 6,000 exams we performed in the first 90 days, only six (6) patients screened positive for the IgM antibody, which may indicate current asymptomatic infection. All six (6) patients were referred out for confirmatory testing, and each patient subsequently received a negative PCR result.

This demonstrates that the first four (4) screening touchpoints have been effective at preventing 99.99% of exposures from occurring.

Thus, from this data, our clinical team determined the most effective way to screen patients safely and efficiently is to discontinue antibody testing and continue with the other four (4) screening touchpoints for our preventive exam patients. In addition, all EHE Health clinics and network providers will continue with their operational safety protocols that include maintaining physical distance, wearing a facemask, performing hand hygiene, and reinforcing enhanced disinfection protocols.
